

Installing LDAP - I have a solution!

Contributed by Michael Felt

Update on Installing LDAP - should be easy

Good news: It is easy - once you have the requirements properly identified. Most locations would not have the issues I have been having - simply because using a (virtual) disk larger than 8G will generally mean you have ample free space in /tmp, /opt, /var and /home. However, if you are looking for a minimal installation footprint be sure to keep watching for a new article real soon.

FYI: I took over 100 screen shots to have a fairly clear review of what is happening, what you should be seeing, etc.. So, in the coming days, as I prepare my presentation "LDAP 101" for Birmingham POWER Technical University from May 8th through 11 - I be readying a new article for here as well.

Next: add RBAC into the LDAP server!
