

ROOTVG wiki - slow going - REDHAT install woes

Contributed by Michael Felt

You may have noticed that ROOTVG WIKI is progressing slowly. Much slower than intended, and I will not bother you - here - with either the personal or technical issues - although I do intend to share most of the technical issues in the wiki as I overcome and/or struggle to overcome them.

The most recent changes are, basically, about the different behavior and possibilities depending on the install interface chosen when installing REDHAT Enterprise 6.5. In short, the CLI (command-line-interface) is very limited compared to the VNC method. I am completely surprised that I can neither choose how to configure the network interface, nor the base install profile. CLI means no network definition, minimal install - PERIOD.
