

Demo: IVM: Activation thru License Acceptance

Contributed by Michael Felt

Integrated Virtual Manager (IVM) is part of the PowerVM (was APV, Advanced Power Virtualization) feature of POWER systems. IVM is a feature of the Virtual I/O Server (VIOS) image that gets activated automatically when the POWER system is not managed by an HMC (Hardware Management Console).

Using IVM is very simple - just point your browser at the IP address of the VIO Server and get started. Although, the first time you will need to login on the console and accept the license. See for yourself.
