

## Cloud-Init for AIX - not an RPM - coming soon!

Contributed by Michael Felt

Last week I was in Cannes, France - attending (and presenting) at the POWER TechU (Tech University). Lots of the usual stuff - but I also expanded my network. In particular - I am going to mention @chmod666 who has requested (read challenged) me to port cloud-init to AIX. Not because cloud-init does not exist already - but because it requires so very very many RPM's to get it loaded.

I am on my way - the first problem was getting a better python package built. Why better? Because the one I have used myself for the ./configure scripts that need it has been sufficient. But not sufficient for cloud-init. So, better means it has more python modules actually built - and included in the packaging.

In short, not done yet (only been one day) - but much closer!
