

Active Directory and AIX default user attributes integration

Contributed by Michael Felt

An awareness thing: where do I set this?

I knew it could be set, and that I read the sentence about it with some frequency.

`defaultentrylocation`

Specifies the location of the default entry.

Valid values are `ldap` and `local`. The default is `ldap`.

`ldap` - Use the default entry in LDAP for all attribute default values.

`local` - Use the default stanza from local `/etc/security/user` file for all attribute default values.

I am sure I will not forget it again - but just in case you are using LDAP - with Active Directory or OpenLDAP as the LDAP server AND!! want to continue to have the AIX default user attributes from `/etc/security/user` - which I do, the place to set it is in `/etc/security/ldap/ldap.cfg`
