

NAS acting up - again

Contributed by Michael Felt

Maybe I should say - acting down, but the real problem is the choice of disk I made over three years ago. I have, literally, lost count of how many of the original 7 disks have failed "SMART" tests - which is when I want to replace them. Of those, at least one (I think two) have died, completely.

So today, as an extra job - I am copying the data off the bad array - to the good array. Further, since the warranty on the disks is past (not IBM stuff btw) - I need to research for disks that last in a harsh environment (internal disk temp 30-35 degrees Celcius - or about 85-95 degrees Farenheit)

My apologies for any downtime as I switch things around!
